[dialectrix.com](http://dialectrix.com) / G4G

Scope Narrowed!

Two kinds of iteration,  
with lots of graphics,  
and a few digressions.

$$N = N + 1$$

AUG 1985

The six components of the iteration diagram for squaring the first 100 integers

$$i \rightarrow i^2 \bmod m$$

EXAMPLE, modulo 10

$$\text{Start with } i = 9 \rightarrow 9^2 \bmod 10 = 81 \bmod 10 = 1$$

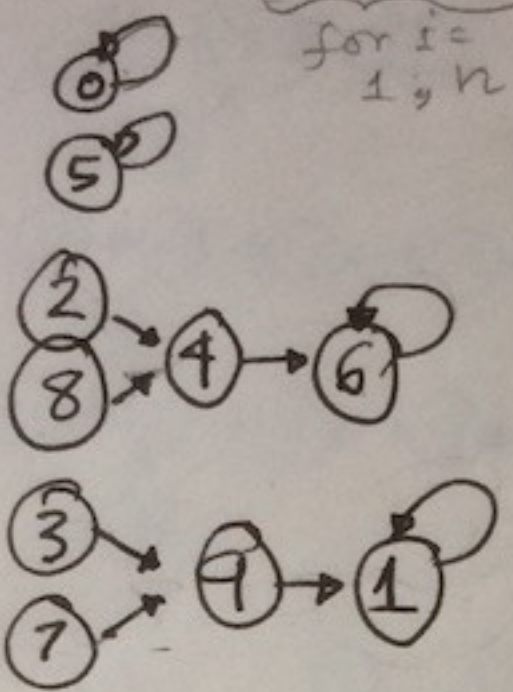

We say... 9 'goes to' 1

10

# Integers

$i$	map	$v_i$	
0	0	1	0
1	1	4	5
2	4	1	2
3	9	0	8
4	6	1	3
5	5	0	7
6	6	1	4
7	9	0	1
8	4	0	
9	1	0	

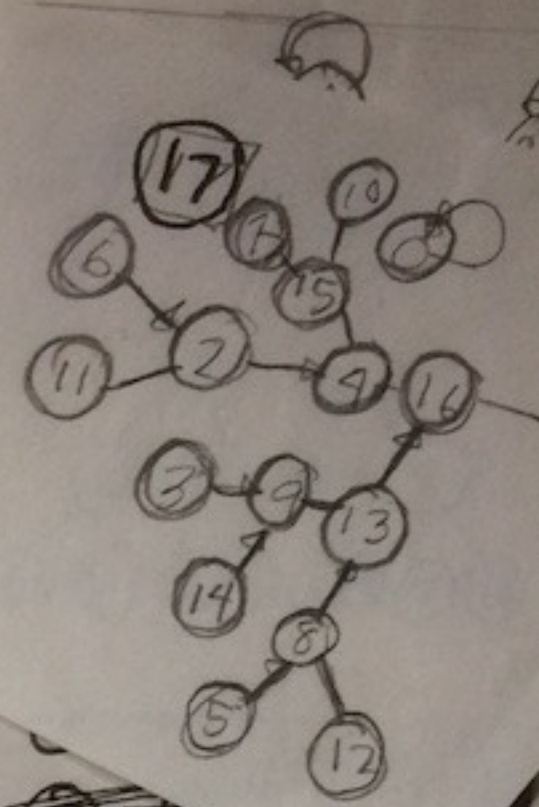

$i^2 \bmod n$   
for  $i = 1, n$

1+1+4+4

1/18/86

11  
8+2

14  
4+4+2+2

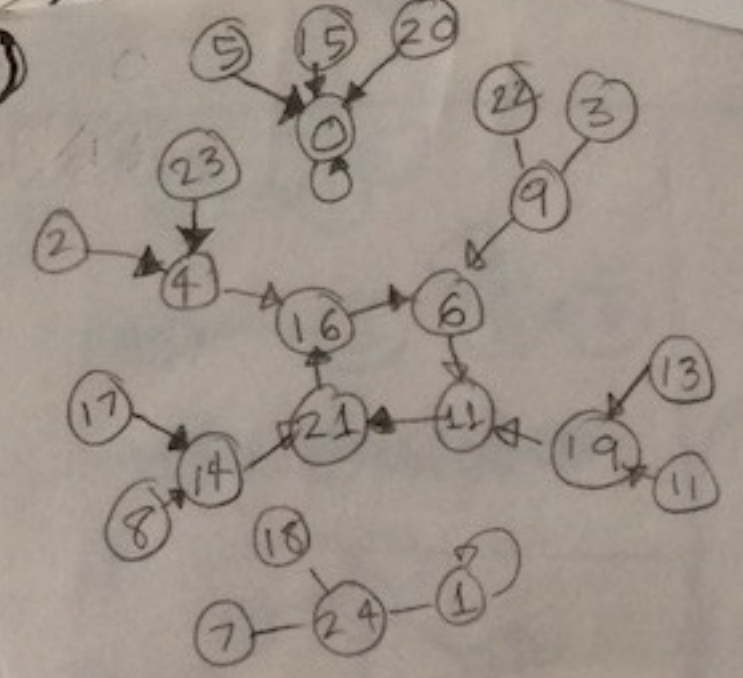

19

22-1

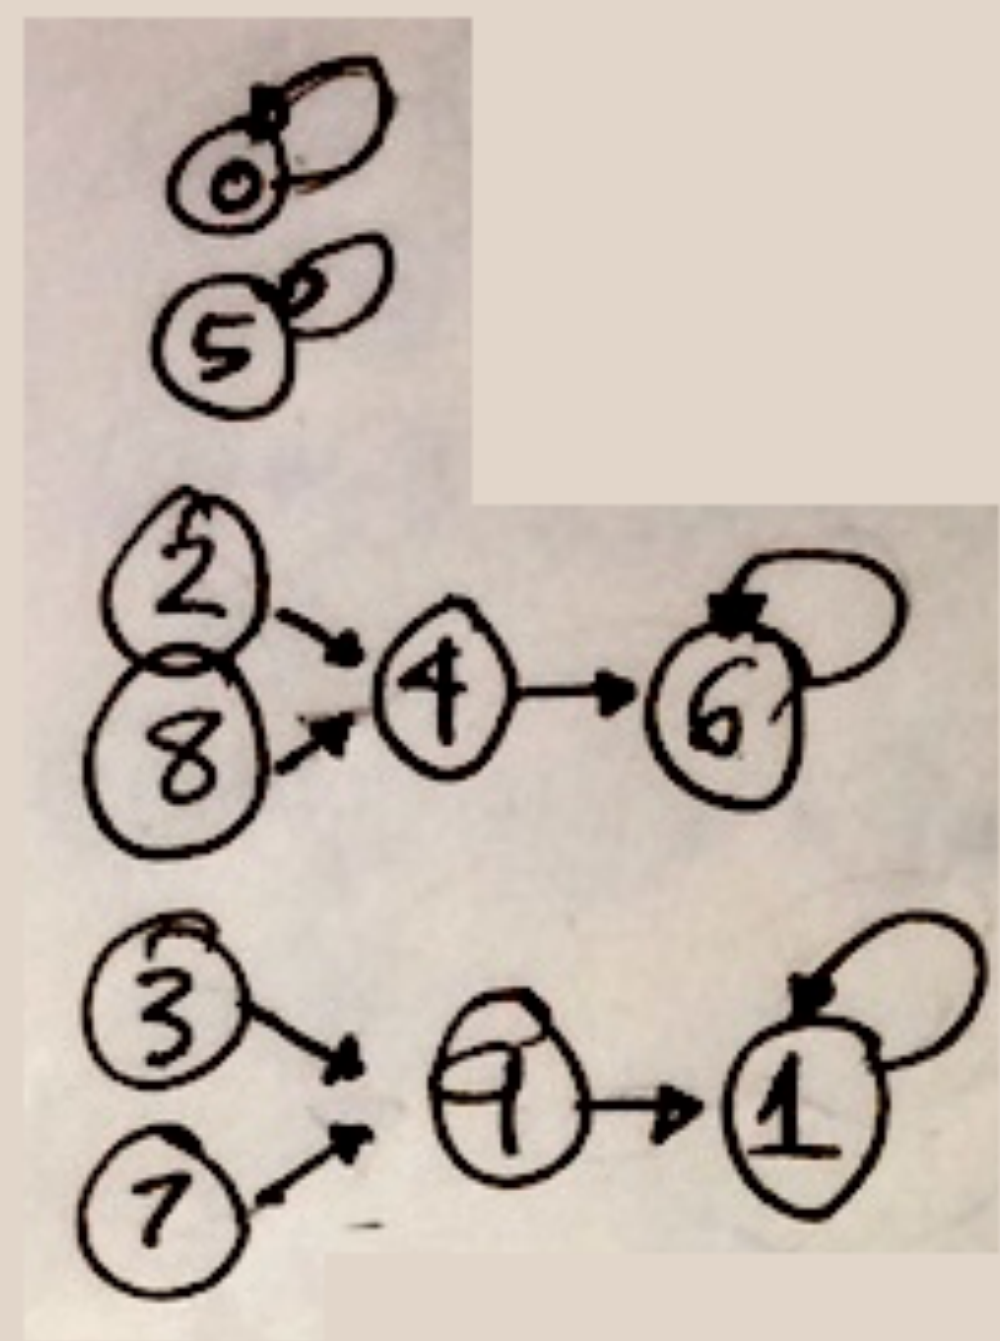

25

24

10

0 → 0  
1 → 1  
2 - 4  
3 - 9  
4 - 6  
5 - 5  
6 → 6  
7 - 9  
8 - 4  
9 - 1

We prepare input for

GraphViz - Neato

layout algorithm

which will automatically

generates a graph... in

PostScript, SVG, et al.

0 -> 0

1 -> 1

2 -> 4

3 -> 9

4 -> 6

5 -> 5

6 -> 6

7 -> 9

8 -> 4

9 -> 1

Isomorphic to my hand drawn graph

100

11 is has 4-cycle

17 has a binary tree with 1 at the root, and 0 is a 'looper'.

19 has a hexagon cycle. Note 11 $\leftrightarrow$ 7 attractor...

22 has TWO 4-cycles

23 has a 10-cycle

**65 - An Attractor for your Birthday**

1001

I have 500+ of these,  
which I plan to make available,  
as a web page and PDF (G4G15?)

# Collatz sequence

$n \rightarrow (3n+1, n/2)$

```
if ( $x % 2 == 0 ) { return $x / 2; } else { return 3 * $x + 1; }
```

This defines a unique successor for every integer!

Examples:

$22 \rightarrow 22/2 = 11$

$21 \rightarrow 3 * 21 + 1 = 64$

2 -> 1; 3 -> 10; 10 -> 5; 5 -> 16; 16 -> 8;

8 -> 4; 4 -> 2; 6 -> 3; 7 -> 22; 22 -> 11;

11 -> 34; 34 -> 17; 17 -> 52; 52 -> 26;

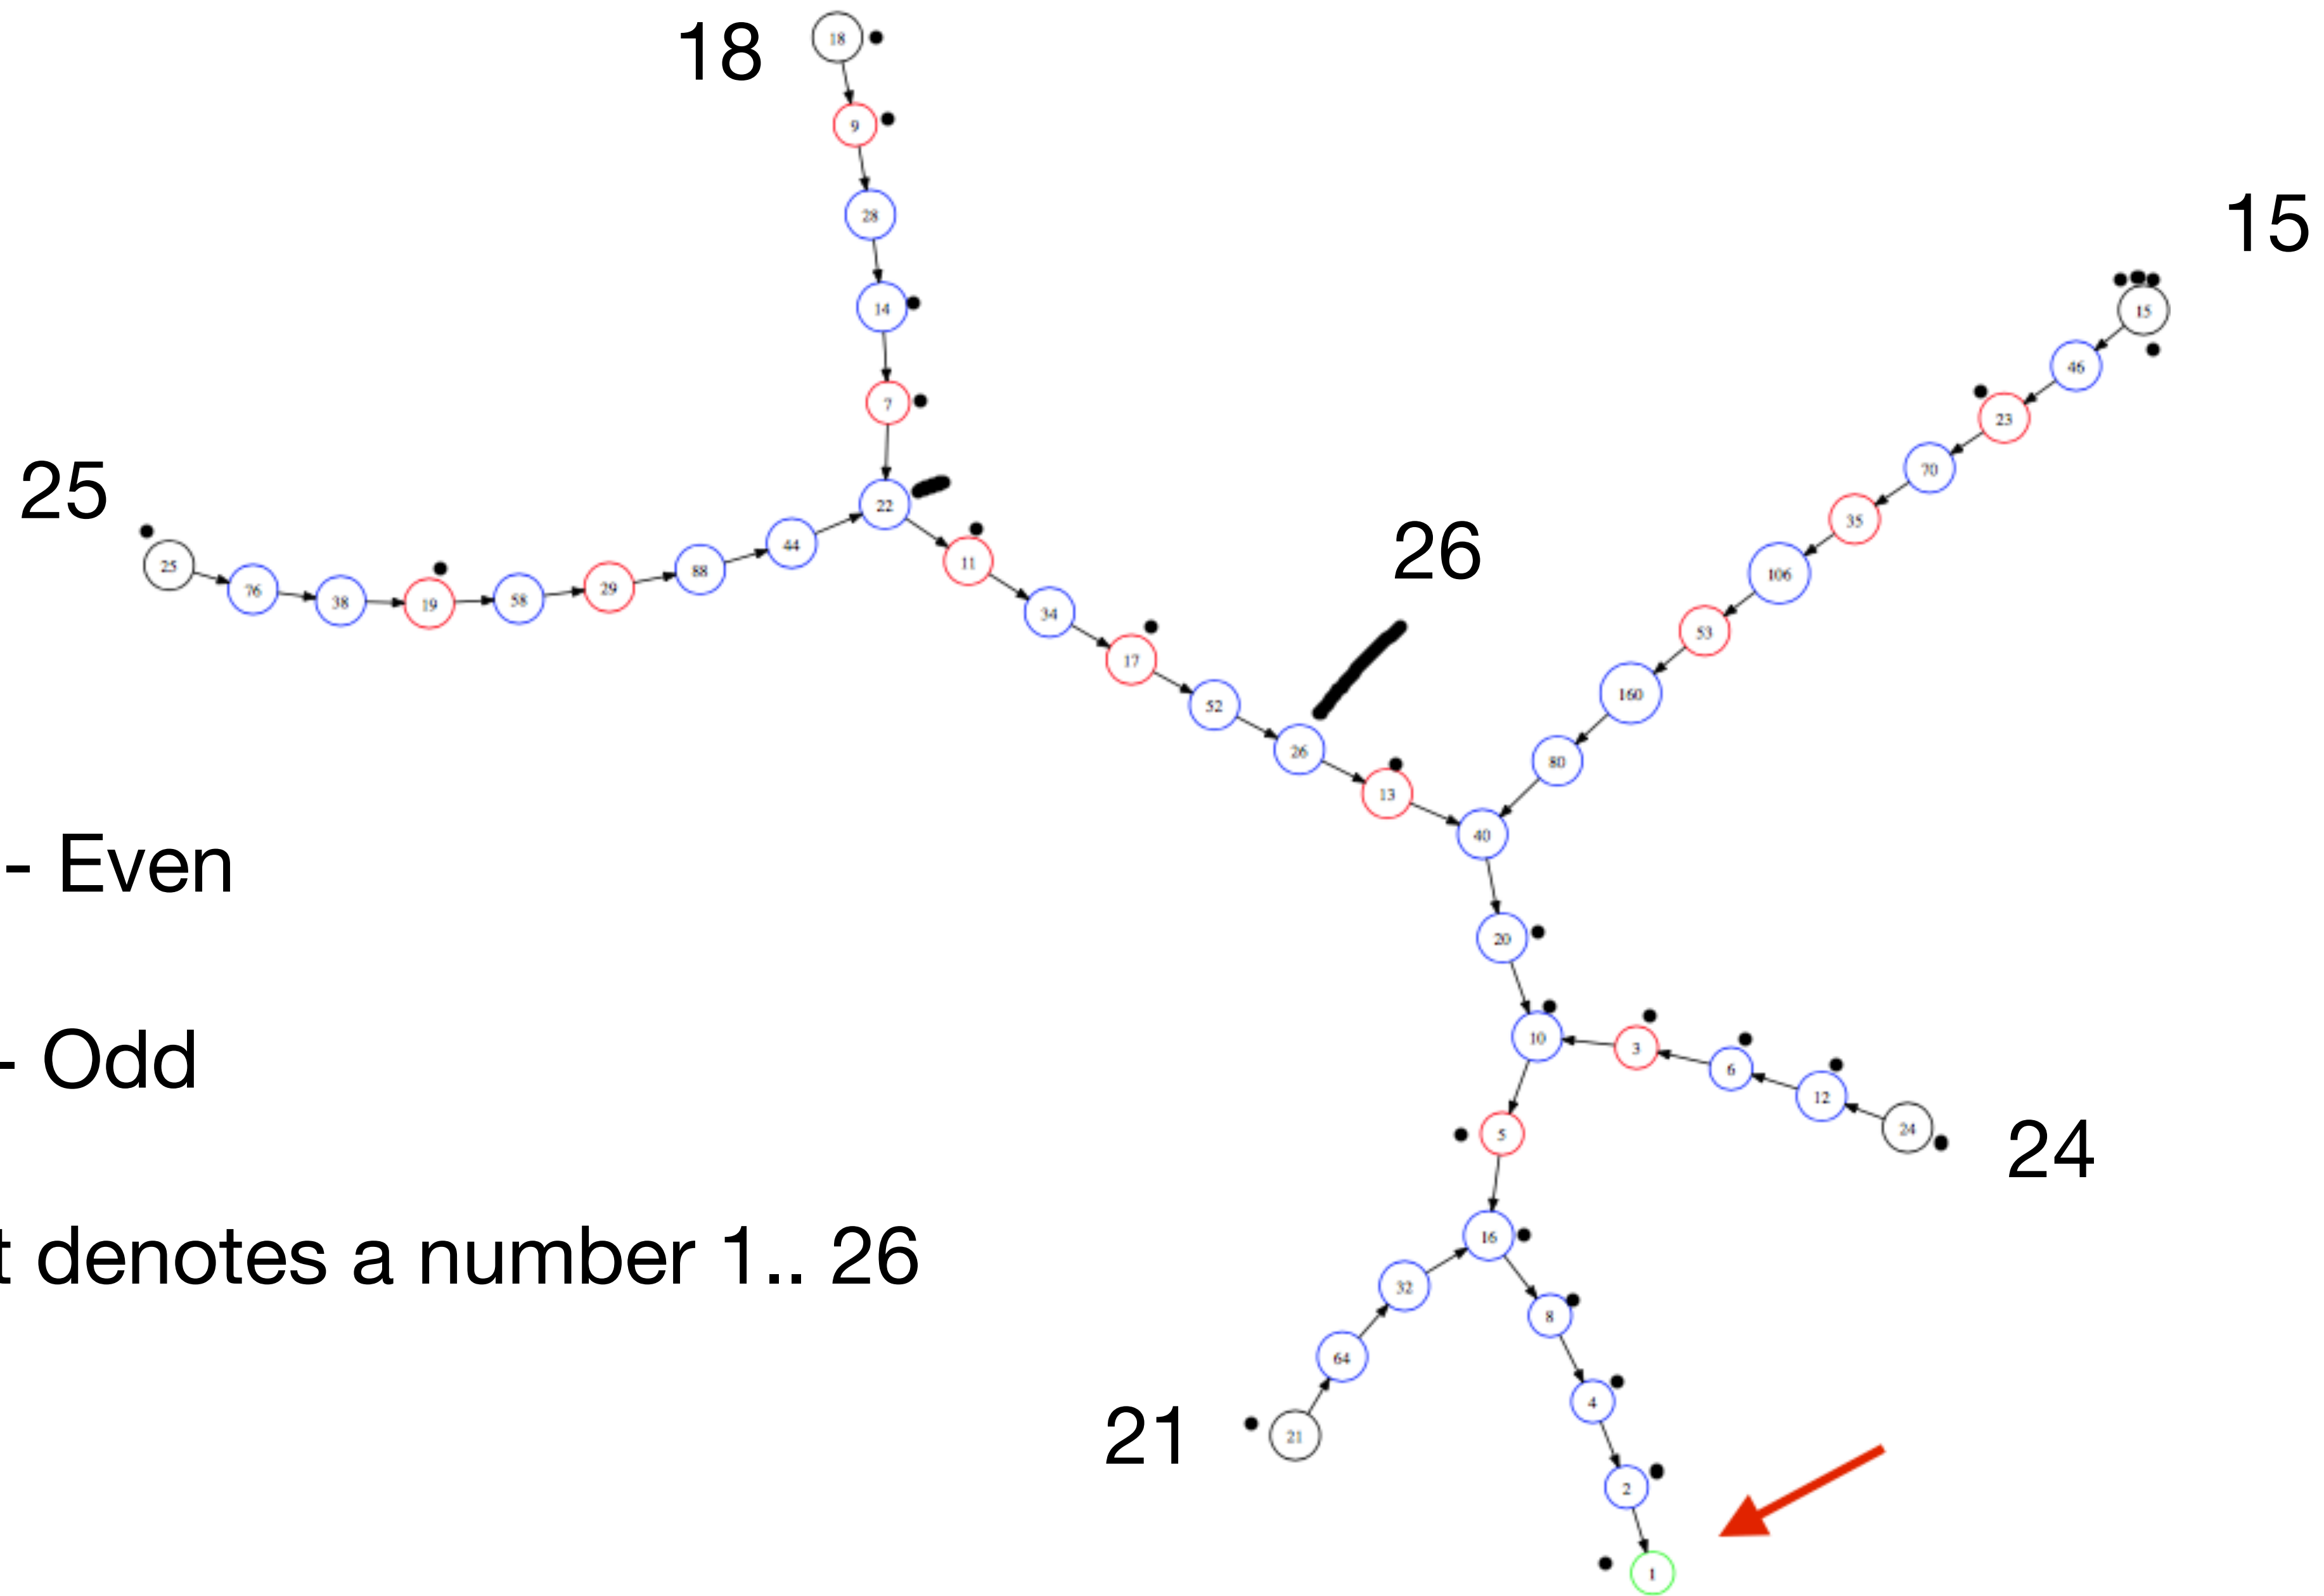

26 -> 13; 13 -> 40; 40 -> 20; 20 -> 10;

9 -> 28; 28 -> 14; 14 -> 7; 12 -> 6; 15 -> 46;

# Wikipedia

All Collatz sequences of a length inferior to 20

(26) See the little 4-2-1 loop at the end.

EXERCISE:

Compute the Collatz Sequence starting with 27.

(JHC)

## Conjecture

All integers are in one CONNECTED graph.

The iteration always ends with '1'.

No number leads to a subgraph that never connects to the main graph.

No sequence falling into a loop that does not terminate with 1.

Brian Hayes wrote an excellent article on  $3x+1$  in Jan 84 SciAm,

Computer Recreations, "On the ups and downs of hailstone numbers"

fin.
